

Website Audit Report

SuketuSarthi.com

Prepared as a best-effort live crawl, UX, content, conversion, SEO, accessibility, and security review

Audit date: 13 March 2026

Overall impression

Trustworthy but dated brochure-style site

Priority

High - conversion, UX polish, and hardening

Best next move

Redesign homepage and contact funnel first

Executive Summary

The site communicates experience and a broad financial-services offering, but it currently behaves more like a static brochure than a high-trust lead-generation website. The messaging is credible, yet the layout, calls-to-action, proof structure, and service-page depth appear outdated and likely underperform for enquiries.

The strongest issues are not cosmetic alone. The homepage structure is long and generic, the contact and enquiry funnel do not appear optimized for conversion, trust signals are present but not organized strategically, and the site likely depends on a WordPress-style stack that should be hardened and maintained aggressively.

From an audit perspective, this is a site that can be improved significantly without changing the business itself. A sharper information architecture, cleaner UI system, stronger proof sections, modern service landing pages, technical hardening, and better analytics setup should materially improve conversions and reduce operational risk.

Audit Scorecard

Area	Score / 10	What it means	Priority
Brand & trust	6.5	Experience is visible, but positioning and proof hierarchy need tightening.	High
UI design	4.5	Functional but visually dated; weak modern polish and spacing rhythm.	High
UX & conversion	4.0	Navigation is basic; enquiry path is too generic and not intent-driven.	High
Content quality	5.5	Service coverage exists, but copy is generic and repetitive.	High
SEO foundations	5.0	Indexable pages exist, but depth, schema, and local SEO likely need work.	Med
Accessibility	4.5	Likely gaps in contrast, alt text quality, and form semantics.	Med
Security posture	4.0	Needs hardening, monitoring, update discipline, and header review.	High
Performance / maintenance	5.0	Unknown exact metrics, but probable image/theme/plugin debt.	Med

Verified Live-Crawl Observations

- The homepage exposes a top navigation with Home, About, Services, and Contact, and service items including Life Insurance, Health Insurance, Mutual Fund, Retirement, General Insurance, and Business Insurance.
- The homepage hero positions the firm around income, wealth, and financial confidence, and states “Since 1994,” which is a strong trust anchor when placed more prominently and supported by proof.
- The homepage includes testimonial content and footer contact details, including dhruva@suketusarthi.com.

- Indexed results show dedicated pages for Contact Us, Mutual Funds, Health Insurance, and Testimonials. The contact page snippet shows fields for name, email, telephone, subject, and message.
- Deep-page fetches for some URLs returned blocked/406 responses during audit access, which limited direct visual capture and suggests bot / crawler filtering at least for some requests.

1. UI / Visual Design Findings

Homepage feels template-led rather than premium-advisor-led

The visible page structure reads like a generalized finance WordPress template: large hero, generic cards, generic stock-style sections, testimonial carousel, and footer CTA. This makes the brand feel less bespoke than the underlying expertise likely is.

Visual hierarchy is inconsistent

Key messages such as “Since 1994,” the service mix, the advisor promise, and the contact path compete instead of forming a clear reading journey. Stronger hierarchy would reduce cognitive load.

Cards and sections likely rely on stock imagery and generic layout blocks

That reduces perceived uniqueness and lowers trust compared with a more authentic, advisor-centric presentation using real profile, team, office, process, and client-case imagery.

Typography and spacing need modernization

Based on the crawl structure and template pattern, the site would benefit from a tighter design system: larger heading rhythm, more whitespace, more disciplined button styles, fewer decorative content breaks, and stronger mobile spacing.

2. UX / Conversion Findings

Primary calls-to-action are too broad

Buttons such as “Know More,” “Ask a Question,” and “Get Started Now” are serviceable, but they do not map strongly to user intent. Replace with actions like “Book a Financial Review,” “Get Insurance Advice,” or “Talk to an Advisor.”

Service discovery is flat

Users appear to browse a broad list of categories, but there is no visible guided journey by customer need: family protection, retirement planning, tax-efficient investing, child education planning, business risk, etc.

Contact funnel likely lacks conversion layers

A simple contact form is not enough for a trust-led advisory business. Add WhatsApp click, callback request, appointment booking, lead qualification, and reassurance text about response time / privacy.

Trust proof is present but not structured for conversion

Testimonials exist, but the site should also use certifications, years of experience, client categories served, claim-assistance process, partner logos, FAQs, and a step-by-step “How we help” section.

3. Content & Messaging Findings

Copy is generic in several sections

Some visible copy explains what insurance or mutual funds are, rather than why this firm is the right guide. Replace commodity explanations with differentiated advisory language.

Opportunity to sharpen positioning

The firm should define one core value proposition such as: “Holistic insurance and investment planning for families and business owners in Thane and Mumbai.”

About-page story should do more selling

Experience since 1994 is powerful, but it should be expanded into a human founder story, philosophy, process, and credibility framework.

Service pages need richer depth

Each service page should include use cases, ideal customer profiles, mistakes to avoid, document checklist, claim/investment process, FAQs, and strong CTAs.

4. Local SEO / Search Findings

The site has indexable service pages

That is a good foundation, but deeper topical coverage is needed for stronger rankings and better commercial intent capture.

Local signals should be strengthened

For an advisor business, the site should emphasize local phrases, embedded map/contact context, local proof, Google Business Profile alignment, and location-based landing pages where relevant.

Content strategy is probably underused

Add educational articles and FAQ pages around term insurance, health insurance renewal, SIP planning, retirement corpus, family financial planning, and claim support topics.

Metadata consistency should be audited page by page

Titles, meta descriptions, canonical tags, Open Graph cards, and schema should be standardized during implementation.

5. Accessibility Findings

Need a formal accessibility pass

A public-services site should verify heading order, keyboard focus visibility, alt text, label association, contrast ratios, and mobile tap targets.

**Forms should have explicit semantic labels and validation messaging**

Do not rely on placeholders alone. Support screen readers and error recovery.

Buttons and links should be more descriptive

Generic CTA labels are weaker for both accessibility and conversion clarity.

Image-heavy sections should not bury important content

Critical trust and contact information must remain accessible even if images fail to load.

6. Security & Platform Findings

Maintenance discipline matters more than appearance

A financial-services site must treat uptime, patching, access control, and malware prevention as business-critical.

Likely CMS / plugin risk surface should be hardened

If the site runs on WordPress or a similar CMS, keep core, theme, and plugins on a controlled update cycle, remove unused plugins/themes, and restrict admin surface.

Form endpoints need anti-spam and abuse protection

Implement reCAPTCHA or turnstile, rate limiting, server-side validation, and logging for all public forms.

Security headers and TLS configuration should be reviewed

Verify HSTS, Content-Security-Policy, Referrer-Policy, X-Content-Type-Options, Permissions-Policy, and frame-ancestors. A finance website should not rely on defaults.

Admin access should be hardened

Use strong passwords, 2FA, IP restrictions where practical, least privilege roles, login attempt limiting, and regular audit of admin users.

Backups and incident recovery should be documented

Daily off-site backups, restore testing, plugin vulnerability scanning, uptime alerts, and malware scanning should be non-negotiable.

Priority Action Plan

#	Action	Impact	Effort	Notes
1	Redesign homepage with a premium advisory layout	Very high	Medium	Use one clear hero, strong proof block, service tiles by customer need, and focused CTA stack.
2	Rebuild contact funnel	Very high	Low	Add WhatsApp, callback request, response-time promise, and privacy reassurance.
3	Rewrite service pages	High	Medium	Each page should explain outcomes, who it is for, FAQs, documents, and next step.
4	Implement local SEO foundation	High	Medium	Google Business Profile alignment, local schema, location copy, and service FAQs.
5	Run CMS hardening + update sweep	High	Low	Patch core/plugins, enable 2FA, remove unused components, backup and monitor.
6	Compress and standardize media	Medium	Low	Convert large images to WebP/AVIF where supported and enforce size caps.
7	Add analytics + conversion tracking	High	Low	Track form submits, WhatsApp clicks, phone clicks, scroll depth, and landing-page performance.
8	Accessibility remediation pass	Medium	Medium	Focus states, labels, alt text, contrast, semantics, and mobile tap target sizing.

Recommended Security Patch Checklist

- Update CMS core, theme, and plugins immediately; remove all inactive plugins and themes.
- Enable 2FA for all admin/editor accounts and enforce strong password policy.
- Restrict /wp-admin and login access where practical; enable login rate limiting and bot protection.
- Disable XML-RPC if not required; close unused endpoints and directory listing.
- Review file permissions and ownership; prevent arbitrary file upload execution.
- Add WAF/CDN protection and uptime monitoring; configure malware scanning and alerting.
- Verify SSL/TLS certificate health and force HTTPS across all canonical URLs.
- Set and validate security headers: HSTS, CSP, Referrer-Policy, X-Content-Type-Options, Permissions-Policy, frame-ancestors.
- Protect forms with anti-spam, server-side validation, CSRF protections, and submission logging.
- Automate daily off-site backups and test restoration quarterly.

Recommended UI Direction

Move from a generic brochure template to a premium local-advisor website. The visual tone should feel calm, trustworthy, and modern: deep navy, muted gold accents, clean white surfaces, high-contrast typography, and authentic photography.

The homepage should follow this order: hero with clear promise -> trust strip (since 1994 / clients served / claim support / response time) -> service pathways by need -> advisor profile -> process -> testimonials -> FAQs -> strong contact CTA.

Avoid overlong generic sections. Every block should answer one question: who are you, why trust you, what do you help with, how does it work, and how can I contact you now.

Appendix A - Homepage visual reference

Crawl-based reconstruction from live homepage text structure.

Appendix B - Contact page visual reference

Crawl-based reconstruction from indexed contact-page snippet.

Appendix B - Crawl-based contact page visual reference
Reconstructed from indexed crawl snippet showing form fields and contact details.

Implementation Sequence

1. Phase 1 (1-2 weeks): security sweep, backups, plugin cleanup, form protection, analytics, page-speed hygiene.
2. Phase 2 (2-4 weeks): homepage redesign, contact funnel redesign, service-page rewrite, stronger trust proof.

Total Project Cost: ₹08,000/- plus 18% GST
